CPT: introduction

The three discrete symmetries of QM, C (charge conjugation), P (parity), and T (time reversal) are known to be violated in nature both singly and in pairs. Only CPT appears to be an exact symmetry of nature.

CPT theorem (Luders, Jost, Pauli, Bell 1955 -1957):

Exact CPT invariance holds for any quantum field theory (flat space-time) which assumes:

(1) Lorentz invariance (2) Locality (3) Unitarity (i.e. conservation of probability).

Testing the validity of the CPT symmetry probes the most fundamental assumptions of our present understanding of particles and their interactions.

Extension of CPT theorem to a theory of quantum gravity far from obvious (e.g. CPT violation appears in some models with space-time foam backgrounds).

No predictive theory incorporating CPT violation => only phenomenological models to be constrained by experiments.

The neutral kaon system offers unique possibilities to test CPT invariance e.g. :

$$\left| m_{K^0} - m_{\bar{K}^0} \right| / m_K < 10^{-18}, \quad \left| m_{B^0} - m_{\bar{B}^0} \right| / m_B < 10^{-14}, \quad \left| m_p - m_{\bar{p}} \right| / m_p < 10^{-8}$$

1) “Standard” tests of CPT symmetry in the neutral kaon system

The neutral kaon system

The time evolution of a two-component state vector Ψ in the $\{K^0, \bar{K}^0\}$ space is given by (Wigner-Weisskopf approximation):

$$i \frac{\partial}{\partial t} \Psi(t) = \mathbf{H} \Psi(t)$$

\mathbf{H} is the effective hamiltonian (non-hermitian), decomposed into a Hermitian Part (mass matrix \mathbf{M}) and an anti-Hermitian part ($i/2$ decay matrix Γ) :

$$\mathbf{H} = \mathbf{M} - \frac{i}{2} \Gamma = \begin{pmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{pmatrix} - \frac{i}{2} \begin{pmatrix} \Gamma_{11} & \Gamma_{12} \\ \Gamma_{21} & \Gamma_{22} \end{pmatrix}$$

Diagonalizing the effective Hamiltonian:

eigenvalues	eigenstates
$\lambda_{S,L} = m_{S,L} - \frac{i}{2} \Gamma_{S,L}$	$ K_{S,L}\rangle = \frac{1}{\sqrt{2(1+ \varepsilon_{S,L})}} [(1+\varepsilon_{S,L}) K^0\rangle \pm (1-\varepsilon_{S,L}) \bar{K}^0\rangle]$
$ K_{S,L}(t)\rangle = e^{-i\lambda_{S,L}t} K_{S,L}(0)\rangle$	$= \frac{1}{\sqrt{(1+ \varepsilon_{S,L})}} [K_{1,2}\rangle + \varepsilon_{S,L} K_{2,1}\rangle]$
$\tau_S \sim 90 \text{ ps}$	 K_{1,2}> are CP=±1 states
$\tau_L \sim 51 \text{ ns}$	
$m_L - m_S = 3.5 \times 10^{-15} \text{ GeV} \sim \Gamma_S / 2$	small CP impurity $\sim 2 \times 10^{-3}$

CPT violation in the neutral kaon system: “standard” picture

CPT violation in the mixing:

$$\varepsilon_{S,L} = \varepsilon \pm \delta$$

$$\varepsilon = \frac{H_{12} - H_{21}}{2(\lambda_S - \lambda_L)} = \frac{-i\Im m_{12} - \Im \Gamma_{12}/2}{\Delta m + i\Delta\Gamma/2}$$

$$\delta = \frac{H_{11} - H_{22}}{2(\lambda_S - \lambda_L)} = \frac{1}{2} \frac{(m_{22} - m_{11}) - (i/2)(\Gamma_{22} - \Gamma_{11})}{\Delta m + i\Delta\Gamma/2}$$

$$m_{11} \equiv m_{K^0}, \quad m_{22} \equiv m_{\bar{K}^0}$$

$$\Gamma_{11} \equiv \Gamma_{K^0}, \quad \Gamma_{22} \equiv \Gamma_{\bar{K}^0}$$

$$\Delta m = m_L - m_S, \quad \Delta\Gamma = \Gamma_S - \Gamma_L$$

- $\delta \neq 0$ implies CPT violation
- $\varepsilon \neq 0$ implies T violation
- $\varepsilon \neq 0$ or $\delta \neq 0$ implies CP violation

(with a phase convention $\Im \Gamma_{12} = 0$)

Assuming $(\Gamma_{\bar{K}^0} - \Gamma_{K^0}) = 0$, i.e. no CPT viol. in decay:

$$|m_{\bar{K}^0} - m_{K^0}| < 4.0 \times 10^{-19} \text{ GeV at 95% C.L.}$$

2) Search for decoherence and CPT violation in the neutral kaon system

Neutral kaon interferometry

$$|i\rangle = \frac{N}{\sqrt{2}} [|K_S(\vec{p})\rangle |K_L(-\vec{p})\rangle - |K_L(\vec{p})\rangle |K_S(-\vec{p})\rangle]$$

Double differential time distribution:

$$I(f_1, t_1; f_2, t_2) = C_{12} \left\{ |\eta_1|^2 e^{-\Gamma_L t_1 - \Gamma_S t_2} + |\eta_2|^2 e^{-\Gamma_S t_1 - \Gamma_L t_2} \right. \\ \left. - 2|\eta_1||\eta_2| e^{-(\Gamma_S + \Gamma_L)(t_1 + t_2)/2} \cos[\Delta m(t_2 - t_1) + \phi_1 - \phi_2] \right\}$$

where $t_1(t_2)$ is the proper time of one (the other) kaon decay into f_1 (f_2) final state and:

$$\eta_i = |\eta_i| e^{i\phi_i} = \langle f_i | T | K_L \rangle / \langle f_i | T | K_S \rangle$$

$$C_{12} = \frac{|N|^2}{2} \left| \langle f_1 | T | K_S \rangle \langle f_2 | T | K_S \rangle \right|^2$$

**characteristic interference term
at a ϕ -factory => interferometry**

$$f_i = \pi^+ \pi^-, \pi^0 \pi^0, \pi l \nu, \pi^+ \pi^- \pi^0, 3\pi^0, \pi^+ \pi^- \gamma \dots \text{etc}$$

Neutral kaon interferometry

Integrating in (t_1+t_2) we get the time difference ($\Delta t = t_1 - t_2$) distribution (1-dim plot simpler to manipulate than 2-dim plot):

$$I(f_1, f_2; \Delta t \geq 0) = \frac{C_{12}}{\Gamma_S + \Gamma_L} \left\{ |\eta_1|^2 e^{-\Gamma_L \Delta t} + |\eta_2|^2 e^{-\Gamma_S \Delta t} - 2|\eta_1||\eta_2| e^{-(\Gamma_S + \Gamma_L)\Delta t/2} \cos(\Delta m \Delta t + \phi_2 - \phi_1) \right\}$$

for $\Delta t < 0$ $\Delta t \rightarrow |\Delta t|$ and $1 \leftrightarrow 2$

From these distributions for various final states f_i one can measure the following quantities:

$$\Gamma_S, \Gamma_L, \Delta m, |\eta_i|, \phi_i \equiv \arg(\eta_i)$$

$\phi \rightarrow K_S K_L \rightarrow \pi^+ \pi^- \pi^+ \pi^-$: CPT violation in correlated K states

In presence of decoherence and CPT violation induced by quantum gravity (CPT operator “ill-defined”) the definition of the particle-antiparticle states could be modified. This in turn could induce a breakdown of the correlations imposed by Bose statistics (EPR correlations) to the kaon state:

[Bernabeu, et al. PRL 92 (2004) 131601, NPB744 (2006) 180].

$$\begin{aligned} |i\rangle &\propto (K^0 \bar{K}^0 - K^0 \bar{K}^0) + \omega (K^0 \bar{K}^0 + K^0 \bar{K}^0) \\ &\propto (K_S K_L - K_L K_S) + \omega (K_S K_S - K_L K_L) \end{aligned}$$

at most one expects:

$$|\omega|^2 = O\left(\frac{E^2/M_{PLANCK}}{\Delta\Gamma}\right) \approx 10^{-5} \Rightarrow |\omega| \sim 10^{-3}$$

In some microscopic models of space-time foam arising from non-critical string theory:

[Bernabeu, Mavromatos, Sarkar PRD 74 (2006) 045014] $|\omega| \sim 10^{-4} \div 10^{-5}$

The maximum sensitivity to ω is expected for $f_1 = f_2 = \pi^+ \pi^-$

All CPTV effects induced by QG ($\alpha, \beta, \gamma, \omega$) could be simultaneously disentangled.

3) Tests of Lorentz invariance and CPT symmetry in the neutral kaon system

CPT and Lorentz invariance violation (SME)

Kostelecky et al. developed a phenomenological effective model providing a framework for CPT and Lorentz violations, based on spontaneous breaking of CPT and Lorentz symmetry, which might happen in quantum gravity (e.g. in some models of string theory)

Standard Model Extension (SME) [Kostelecky PRD61, 016002, PRD64, 076001]

CPT violation in neutral kaons according to SME:

- CPTV only in mixing, not in decay, at first order (i.e. $B_I = y = x_- = 0$)
- δ cannot be a constant (momentum dependence)

$$\varepsilon_{S,L} = \varepsilon \pm \delta$$

$$\boxed{\delta = i \sin \phi_{SW} e^{i\phi_{SW}} \gamma_K (\Delta a_0 - \vec{\beta}_K \cdot \Delta \vec{a}) / \Delta m}$$

where Δa_μ are four parameters associated to SME lagrangian terms and related to CPT and Lorentz violation.

CPT and Lorentz invariance violation (SME)

$$\delta = i \sin \phi_{SW} e^{i\phi_{SW}} \gamma_K (\Delta a_0 - \vec{\beta}_K \cdot \Delta \vec{a}) / \Delta m$$

δ depends on sidereal time t since laboratory frame rotates with Earth (fixed beam).

For a ϕ -factory there is an additional dependence on the polar and azimuthal angle θ, ϕ of the kaon momentum in the laboratory frame:

$$\begin{aligned} \bar{\delta}(|\vec{p}|, \theta, t) &= \frac{1}{2\pi} \int_0^{2\pi} \delta(\vec{p}, t) d\phi \\ &= \frac{i \sin \phi_{SW} e^{i\phi_{SW}}}{\Delta m} \gamma_K \left[\underline{\Delta a_0} + \underline{\beta_K \Delta a_Z} \cos \chi \cos \theta \right. \\ &\quad + \underline{\beta_K \Delta a_Y} \sin \chi \cos \theta \sin \Omega t \\ &\quad \left. + \underline{\beta_K \Delta a_X} \sin \chi \cos \theta \cos \Omega t \right] \end{aligned}$$

Ω : Earth's sidereal frequency
 χ : angle between the z lab. axis and the Earth's rotation axis

CPT and Lorentz invariance violation (SME)

$$\delta = i \sin \phi_{SW} e^{i\phi_{SW}} \gamma_K (\Delta a_0 - \vec{\beta}_K \cdot \Delta \vec{a}) / \Delta m$$

(in general z lab. axis is non-normal to Earth's surface)

Ω : Earth's sidereal frequency
 χ : angle between the z lab. axis and the Earth's rotation axis

CPT and Lorentz invariance violation (SME)

$$\delta = i \sin \phi_{SW} e^{i\phi_{SW}} \gamma_K (\Delta a_0 - \vec{\beta}_K \cdot \Delta \vec{a}) / \Delta m$$

δ depends on sidereal time t since laboratory frame rotates with Earth (fixed beam).

For a ϕ -factory there is an additional dependence on the polar and azimuthal angle θ, ϕ of the kaon momentum in the laboratory frame:

$$\begin{aligned} \bar{\delta}(|\vec{p}|, \theta, t) &= \frac{1}{2\pi} \int_0^{2\pi} \delta(\vec{p}, t) d\phi \\ &= \frac{i \sin \phi_{SW} e^{i\phi_{SW}}}{\Delta m} \gamma_K \left[\underline{\Delta a_0} + \underline{\beta_K \Delta a_Z} \cos \chi \cos \theta \right. \\ &\quad + \underline{\beta_K \Delta a_Y} \sin \chi \cos \theta \sin \Omega t \\ &\quad \left. + \underline{\beta_K \Delta a_X} \sin \chi \cos \theta \cos \Omega t \right] \end{aligned}$$

At DAΦNE K mesons are produced with angular distribution $dN/d\Omega \propto \sin^2 \theta$

Ω : Earth's sidereal frequency
 χ : angle between the z lab. axis and the Earth's rotation axis

Measurement of Δa_0 at KLOE

Δa_0 from K_S and K_L semileptonic charge asymmetries

tagged K_S and K_L
(symmetric polar angle θ and
sidereal time t integration)

$$A_{S,L} = \frac{\Gamma(K_{S,L} \rightarrow \pi^- e^+ \nu) - \Gamma(K_{S,L} \rightarrow \pi^+ e^- \bar{\nu})}{\Gamma(K_{S,L} \rightarrow \pi^- e^+ \nu) + \Gamma(K_{S,L} \rightarrow \pi^+ e^- \bar{\nu})}$$
$$= 2\Re\epsilon \pm 2\Re\delta - 2\Re y \pm 2\Re x$$

$$\begin{aligned}\bar{\delta}(|\vec{p}|, \theta, t) &= \frac{i \sin \phi_{SW} e^{i\phi_{SW}}}{\Delta m} \gamma_K [\Delta a_0 + \cancel{\beta_K \Delta a_Z \cos \chi \cos \theta} \\&\quad + \cancel{\beta_K \Delta a_Y \sin \chi \cos \theta \sin \Omega t} \\&\quad + \cancel{\beta_K \Delta a_X \sin \chi \cos \theta \cos \Omega t}]\end{aligned}$$

$$A_S - A_L \cong \frac{4\Re(i \sin \phi_{SW} e^{i\phi_{SW}}) \gamma_K}{\Delta m} \Delta a_0$$

with $L=400 \text{ pb}^{-1}$ (preliminary):

$$\Delta a_0 = (0.4 \pm 1.8) \times 10^{-17} \text{ GeV}$$

(Δa_0 evaluated for the first time)

with $L=2.5 \text{ fb}^{-1}$: $\sigma(\Delta a_0) \sim 7 \times 10^{-18} \text{ GeV}$

Measurement of $\Delta a_{X,Y,Z}$ at KLOE

$\Delta a_{X,Y,Z}$ from $\phi \rightarrow K_S K_L \rightarrow \pi^+ \pi^- \pi^+ \pi^-$
 (analysis vs polar angle θ and sidereal time t)

$$\eta_{+-} = \varepsilon - \delta(p, \theta, t)$$

$$I[\pi^+ \pi^-(\cos \theta > 0), \pi^+ \pi^-(\cos \theta < 0); \Delta t]$$

- at $\Delta t \gg \tau_s$ sensitive to $\text{Re}(\delta/\varepsilon) = 0$
- at $\Delta t \sim \tau_s$ sensitive to $\text{Im}(\delta/\varepsilon)$

With $L=1 \text{ fb}^{-1}$ (preliminary):

$$\Delta a_X = (-6.3 \pm 6.0) \times 10^{-18} \text{ GeV}$$

$$\Delta a_Y = (2.8 \pm 5.9) \times 10^{-18} \text{ GeV}$$

$$\Delta a_Z = (2.4 \pm 9.7) \times 10^{-18} \text{ GeV}$$

KTeV : $\Delta a_X, \Delta a_Y < 9.2 \times 10^{-22} \text{ GeV}$ @ 90% CL

BABAR $\Delta a_{x,y}^B, (\Delta a_0^B - 0.30 \Delta a_Z^B) \sim O(10^{-13} \text{ GeV})$

4) Future plans

KLOE-2 at upgraded DAΦNE

Upgrade of DAΦNE in luminosity:

Crabbed waist scheme at DAΦNE (proposal by P. Raimondi)

- increase L by a factor O(5)
- requires minor modifications
- relatively low cost
- Successful experimental test at DAΦNE

KLOE-2 Plan:

- { - phase 0: KLOE restart taking data end 2009 with a minimal upgrade ($L \sim 5 \text{ fb}^{-1}$)
- phase 1: full KLOE upgrade (KLOE-2) > 2011 ($L > 20 \text{ fb}^{-1}$)

Physics issues:

- Neutral kaon interferometry, CPT symmetry & QM tests
- Kaon physics, CKM, LFV, rare K_S decays
- η, η' physics
- Light scalars, $\gamma\gamma$ physics
- Hadron cross section at low energy, muon anomaly

Detector upgrade issues:

- Inner tracker R&D
- $\gamma\gamma$ tagging system
- Calorimeter, increase of granularity
- FEE maintenance and upgrade
- Computing and networking update
- etc.. (Trigger, software, ...)

DAΦNE Luminosity versus colliding currents

NEW COLLISION SCHEME:
Large Piwinski angle
Crab-Waist compensation SXTs

original collision scheme

DAΦNE Luminosity versus colliding currents

Interferometry at KLOE-2: $\phi \rightarrow K_S K_L \rightarrow \pi^+ \pi^- \pi^+ \pi^-$

Possible signal of decoherence concentrated at very small Δt

$I(\pi^+ \pi^-, \pi^+ \pi^-; \Delta t)$ (a.u.)

Theoretical distribution

$I(\pi^+ \pi^-, \pi^+ \pi^-; \Delta t)$ (a.u.)

Reconstructed distribution (MC)

Inner tracker at KLOE

- 5 independent tracking layers for a fine vertex reconstruction of K_S and η
- $200 \mu\text{m} \sigma_{r\phi}$ and $500 \mu\text{m} \sigma_z$ spatial resolutions with XV readout
- 700 mm active length
- from 150 to 250 mm radii
- 1.8% X_0 total radiation length in the active region
- Realized with Cylindrical-GEM detectors

Conclusions

- The neutral kaon system is an excellent laboratory for the study of CPT symmetry and the basic principles of Quantum Mechanics;
 - Several parameters related to possible
 - CPT violation (within QM)
 - CPT violation and decoherence
 - CPT violation and Lorentz symmetry breakinghave been recently measured at KLOE, in some cases with a precision reaching the interesting Planck's scale region;
 - All results are consistent with no CPT violation
 - The analysis of the full KLOE data sample is completed (apart the analysis of CPTV and LV);
 - KLOE and DAΦNE are going to be upgraded
 - KLOE (KLOE-2) will restart taking data at the end of this year
 - Neutral kaon interferometry, CPT symmetry and QM tests are one of the main issues of the KLOE-2 physics program
 - Other interesting QM tests possible, e.g. quantum eraser.
