

Statistical analysis of experimental data

Introduction to Python

Artur Kalinowski

Lecture 02

October 12, 2023

Lecture concept

The goal of the lecture is not only to present the theoretical concepts but also to demonstrate how they can be applied in practical terms to data analysis.

Different concepts as well as analysis methods will be discussed using code examples.

We will address many (relatively simple) problems and try to look at their numerical solutions.

All examples presented are based on Python and multiple additional packages, which will be shortly introduced today.

Web resources

Kampus platform will be used for lecture slides, Python notebooks, as well as home exercises (and final exam):

<https://kampus-student2.ckc.uw.edu.pl/course/view.php?id=14456>

All files will also be available from the dedicated web page:

<http://www.fuw.edu.pl/~zarnecki/SAED/>

accessible without USOS account...

Containers

To avoid the burden of installing and configuring all the required packages on your personal computers, we will use virtual environments known as containers. Containers are lightweight versions of old time virtual machines. Two popular environments used to run the containers:

- [Apptainer](#) (previously singularity; still difficult to find in Google)
- [Docker](#)

Both Docker and Apptainer can use the same input files.

[Docker](#) is available for any operating system, [Apptainer](#) only for Linux ones.

Notebooks presented at this lecture are developed with [akalinow/root-fedora35](#) container prepared for the other course some time ago. This is a container based on Fedora Linux ditribution, and conains all packages we will use during the classes.

Detailed instructions on installing and starting Docker are given [here](#)

Git and Google Colaboratory

All scripts discussed during the course will be available for download at the Kampus platform and the dedicated lecture web page. They will also be uploaded to github repository:

<https://github.com/zarnecki/SAED>

You also open them in your browser using the Google Colab platform.

To do so, use `plots/colab.png` link and select the notebook you want to load.

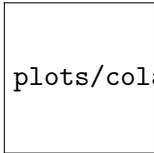

Please remember that you need to save the file to (your) Google Disc before you make any modifications. Otherwise, all your changes will be lost!..

Python tools

One of the main advantages of Python is the large number of diverse packages developed for various applications...

During the course we will use the following packages for computation and plotting:

- [numpy](#) - The fundamental package for scientific computing with Python
- [matplotlib](#) - Visualization with Python
- [SciPy](#) - Fundamental algorithms for scientific computing in Python
- [scikit-learn](#) - Machine Learning in Python, simple and efficient
- [pandas](#) - Handling more complex data structures

See lecture notebook for more details and examples:

NumPy documentation

Version: 2.0.dev0

Download documentation: [Historical versions of documentation](#)

Useful links: [Installation](#) | [Source Repository](#) | [Issue Tracker](#) | [Q&A Support](#) | [Mailing List](#)

NumPy is the fundamental package for scientific computing in Python. It is a Python library that provides a multidimensional array object, various derived objects (such as masked arrays and matrices), and an assortment of routines for fast operations on arrays, including mathematical, logical, shape manipulation, sorting, selecting, I/O, discrete Fourier transforms, basic linear algebra, basic statistical operations, random simulation and much more.

Getting Started

User Guide

Matplotlib: Visualization with Python

Matplotlib is a comprehensive library for creating static, animated, and interactive visualizations in Python. Matplotlib makes easy things easy and hard things possible.

- Create [publication quality plots](#).
- Make [interactive figures](#) that can zoom, pan, update.
- [Customize visual style and layout](#).
- Export to many [file formats](#).
- Embed in [JupyterLab](#) and [Graphical User Interfaces](#).
- Use a rich array of [third-party packages](#) built on Matplotlib.

`errorbar(x, y, yerr, xerr)`

Try Matplotlib (on Binder)

Fundamental algorithms for scientific computing in Python

GET STARTED

SciPy 1.11.3 released! 2023-09-27

FUNDAMENTAL ALGORITHMS

SciPy provides algorithms for optimization, integration, interpolation, eigenvalue problems, algebraic equations, differential equations, statistics and many other classes of problems.

BROADLY APPLICABLE

The algorithms and data structures provided by SciPy are broadly applicable across domains.

pandas documentation

Date: Sep 20, 2023 **Version:** 2.1.1

Download documentation: [Zipped HTML](#)

Previous versions: Documentation of previous pandas versions is available at pandas.pydata.org.

Useful links: [Binary Installers](#) | [Source Repository](#) | [Issues & Ideas](#) | [Q&A Support](#) | [Mailing List](#)

pandas is an open source, BSD-licensed library providing high-performance, easy-to-use data structures and data analysis tools for the [Python](#) programming language.

Getting started

New to *pandas*? Check out the getting started guides.

Getting Started

Release Highlights for 1.3

GitHub

- Simple and efficient tools for predictive data analysis
- Accessible to everybody, and reusable in various contexts
- Built on NumPy, SciPy, and matplotlib
- Open source, commercially usable - BSD license

Classification

Identifying which category an object belongs to.

Applications: Spam detection, image recognition.

Algorithms: Gradient boosting, nearest neighbors, random forest, logistic regression, and more...

Examples

Regression

Predicting a continuous-valued attribute associated with an object.

Applications: Drug response, Stock prices.

Algorithms: Gradient boosting, nearest neighbors, random forest, ridge, and more...

Examples

Clustering

Automatic grouping of similar objects into sets.

Applications: Customer segmentation, Grouping experiment outcomes

Algorithms: k-Means, HDBSCAN, hierarchical clustering, and more...

Examples

Graphical presentation of the data

Look for the recent data describing age and gender structure of the population of Poland. One of the possible sources is the [Central Statistical Office \(Polish: Główny Urząd Statystyczny\)](#) or [Poland's Data Portal](#).

- 1 Prepare the plot showing the gender balance (men to women ratio) as a function of age.
- 2 Can the observed dependence be used to draw any conclusions concerning the life expectancy? Why do you think so?

Solutions should be uploaded until October 26.

Solutions (dedicated files or screenshots of the notebook final output) should be uploaded to Kampus in readable format (PDF, JPG, PNG). You should add the link to your notebook in Google Colab as a comment.

Please share your Google Colab space with a.zarnecki@uw.edu.pl, so I can have a look at your notebook, if needed.
