Electroweak Physics and Beyond the Standard Model session

April 14, 2021

- 1 Introduction
- 2 Analysis framework
- 3 Results
- 4 Conclusions

## Dark Matter production

The mono-photon signature is considered to be the most general way to look for **DM particle production** in future  $e^+e^-$  colliders.

DM can be pair produced in the  $e^+e^-$  collisions via exchange of a new **mediator particle**, which couples to both electrons (SM) and DM states

This process can be detected, if **additional hard photon radiation** from the initial state is observed in the detector...

Considered in this contribution is radiative DM production at **high energy  $e^+e^-$  colliders**: 500 GeV ILC and 3 TeV CLIC.

## International Linear Collider

ILC Scheme | © www.fzj.de

Technical Design (TDR) completed in 2013

[arXiv:1306.6328](https://arxiv.org/abs/1306.6328)

- superconducting accelerating cavities
- 250 – 500 GeV c.m.s. energy (baseline), 1 TeV upgrade possible
- footprint 31 km
- polarisation for both  $e^-$  and  $e^+$  (80%/30%)

## Compact Linear Collider

Conceptual Design (CDR) presented in 2012

CERN-2012-007

- high gradient, two-beam acceleration scheme
- staged implementation plan with energy from 380 GeV to 3 TeV
- footprint of 11 to 50 km
- $e^-$  polarisation (80%)

For details refer to [arXiv:1812.07987](https://arxiv.org/abs/1812.07987)

## Running scenarios

### ILC

Total of  $4000 \text{ fb}^{-1}$  assumed at  $500 \text{ GeV}$  (H-20 scenario)

- $2 \times 1600 \text{ fb}^{-1}$  for LR and RL beam polarisation combinations
- $2 \times 400 \text{ fb}^{-1}$  for RR and LL beam polarisation combinations

assuming polarisation of  $\pm 80\%$  for electrons and  $\pm 30\%$  for positrons

[arXiv:1903.01629](https://arxiv.org/abs/1903.01629)

### CLIC

Total of  $5000 \text{ fb}^{-1}$  assumed at  $3 \text{ TeV}$

- $4000 \text{ fb}^{-1}$  for negative electron beam polarisation
- $1000 \text{ fb}^{-1}$  for positive electron beam polarisation

assuming polarisation of  $\pm 80\%$  for electrons

[arXiv:1812.06018](https://arxiv.org/abs/1812.06018)

## Unique analysis approach

Most of the studies performed so far focused on **heavy mediator** exchange (EFT limit) and **coupling values  $\mathcal{O}(1)$**

⇒ extracted were limits on DM or mediator masses

In our study:

- focus on **light mediator** exchange (**DM even lighter**)
- consider **very small mediator couplings** to SM,  $\Gamma_{\text{SM}} \ll \Gamma_{\text{tot}}$

“Experimental” approach (**model-independent**)

⇒ focus on cross section limits as a function of mediator mass and width

ILD study: [arXiv:2001.03011](https://arxiv.org/abs/2001.03011)

Phys. Rev. D 101, 075053 (2020)

CLIC study: [arXiv:2103.06006](https://arxiv.org/abs/2103.06006)

## Simulating mono-photon events

Dedicated simulation procedure for WHIZARD, with all “detectable” photons generated on Matrix Element level, matched with soft ISR.

For details: J. Kalinowski et al., Eur. Phys. J. C 80 (2020) 634, arXiv:2004.14486

Two variables, calculated separately for each emitted photon:

$$q_- = \sqrt{4E_0 E_\gamma} \cdot \sin \frac{\theta_\gamma}{2},$$

$$q_+ = \sqrt{4E_0 E_\gamma} \cdot \cos \frac{\theta_\gamma}{2},$$

are used to separate “soft ISR” emission region from the region described by ME calculations.

## Event selection

On generator level:

- 1, 2 or 3 ME photons  
nonradiative events for signal only (for normalisation)
- all ME photons with  $q_{\pm} > 1 \text{ GeV}$  &  $E^{\gamma} > 1 \text{ GeV}$   
rejected are events with  $q_{\pm} > 1 \text{ GeV}$  &  $E^{\gamma} > 1 \text{ GeV}$  for any of the ISR photons
- at least one ME photon with  $p_T^{\gamma} > 2 \text{ GeV}$  &  $5^{\circ} < \theta^{\gamma} < 175^{\circ}$  (ILC 500 GeV)  
 $p_T^{\gamma} > 5 \text{ GeV}$  &  $7^{\circ} < \theta^{\gamma} < 173^{\circ}$  (CLIC 3 TeV)

Delphes framework used for detector simulation and event reconstruction.

Require:

- single photon with  $p_T^{\gamma} > 3 \text{ GeV}$  &  $|\eta^{\gamma}| < 2.8$  (ILC)  
 $p_T^{\gamma} > 10 \text{ GeV}$  &  $|\eta^{\gamma}| < 2.6$  (CLIC)
- no other activity in the detector  
other reconstructed objects
  - no electrons
  - no LumiCal photons
  - no BeamCal photons
  - no jets

## Background distributions

For mono-photon events, two SM backgrounds are relevant:  
 (radiative) **Bhabha scattering** and (radiative) **neutrino pair production**

Two variables fully describe mono-photon event kinematics  
 $\Rightarrow$  use 2D distribution of  $(p_T^\gamma, \eta_\gamma)$  to constrain DM production

ILC 500 GeV

(-80%/+30%)  $1600 \text{ fb}^{-1}$

CLIC 3 TeV

(+80%)  $1000 \text{ fb}^{-1}$

## Signal distributions

Simplified DM model used to simulate DM pair-production (see backup)

Expected mono-photon distribution for fermion DM with  $M_\chi = 50$  GeV and **vector mediator** of

400 GeV @ ILC

2.4 TeV @ CLIC  $\Gamma/M = 0.03$

Signal normalised to unpolarised DM pair-production cross section of 1 fb

## Cross section limits for radiative events (with tagged photon)

Vector mediator with  $\Gamma/M = 3\%$

ILC @ 500 GeV

CLIC @ 3 TeV

Limits calculated with CL<sub>s</sub> approach using RooFit v3.60

## Cross section limits for total DM production cross section

Corrected for probability of hard photon tagging! see backup slides

Combined limits for mediator with  $\Gamma/M = 3\%$

ILC @ 500 GeV

CLIC @ 3 TeV

Radiation suppressed for narrow mediator with  $M_\gamma \sim \sqrt{s} \Rightarrow$  weaker limits

## Impact of systematic uncertainties

following ILD study: Phys. Rev. D 101, 075053 (2020), arXiv:2001.03011

Cross section limits for mediator with  $\Gamma/M = 3\%$

ILC @ 500 GeV

CLIC @ 3 TeV

Influence of systematic effects reduced for light mediators,  $M_\gamma < \sqrt{s}$

## Coupling limits with systematic uncertainties

Combined coupling limits for assumed mass and width of the mediator.

ILC @ 500 GeV

CLIC @ 3 TeV

Almost uniform sensitivity to  $g_{eeY}$  up to kinematic limit.

Coupling limits weakly dependent on the assumed coupling structure!

## Coupling limits with systematic uncertainties

Combined coupling limits for assumed mass and width of the mediator.

ILC @ 500 GeV

CLIC @ 3 TeV

Almost uniform sensitivity to  $g_{eeY}$  up to kinematic limit.

Coupling limits weakly dependent on the assumed coupling structure!

New framework for **mono-photon analysis** developed  
**focus on light mediator exchange and very small mediator couplings to SM**

Mono-photon production at  $e^+e^-$  colliders sensitive  
to wide range of **DM pair-production scenarios**

- $\mathcal{O}(1 \text{ fb})$  limits on the radiative production  $e^+e^- \rightarrow \chi\chi\gamma_{\text{tag}}$
- $\mathcal{O}(10 \text{ fb})$  limits on the DM pair-production  $e^+e^- \rightarrow \chi\chi(\gamma)$   
except for the resonance region  $M_\gamma \sim \sqrt{s}$
- $\mathcal{O}(10^{-3} - 10^{-2})$  limits on the mediator coupling to electrons  
up to the kinematic limit  $M_\gamma \leq \sqrt{s}$

Limits largely independent on the mediator type/coupling

For heavy mediators, limits from EFT analysis can be reproduced

For light mediators limits more stringent than those expected from direct  
resonance search in SM decay channels

**Thank you!**

## Simplified DM model

Simplified model covering most popular scenarios of DM pair-production

Possible DM candidates:

- real or complex scalar
- Majorana or Dirac fermion
- real vector

Possible mediators:

- scalar
- pseudo-scalar
- vector
- axial-vector

(mixed couplings, eg. V-A or V+A, also possible)

Cross section for  $e^+e^- \rightarrow \chi\chi$  for  
 $M_\chi = 50 \text{ GeV}$  and  $M_Y = 300 \text{ GeV}$

## Simplified DM model

Dark matter particles,  $X_i$ , couple to the SM particles via an mediator,  $Y_j$ .

Each simplified scenario is characterized by **one dark matter candidate** and **one mediator** from the set listed below:

	particle	mass	spin	charge	self-conjugate	type
DM	$X_R$	$m_{X_R}$	0	0	yes	real scalar
	$X_C$	$m_{X_C}$	0	0	no	complex scalar
	$X_M$	$m_{X_M}$	$\frac{1}{2}$	0	yes	Majorana fermion
	$X_D$	$m_{X_D}$	$\frac{1}{2}$	0	no	Dirac fermion
	$X_V$	$m_{X_V}$	1	0	yes	real vector
mediator	$Y_R$	$m_{Y_R}$	0	0	yes	real scalar
	$Y_V$	$m_{Y_C}$	1	0	yes	real vector
	$T_C$	$m_{T_C}$	0	1	no	charged scalar

## Simplified DM model

Lagrangian describing mediator coupling to electrons given by

$$\mathcal{L}_{eeY} \ni \bar{e}(g_{eY_R}^1 + v\gamma^5 g_{eY_R}^5)eY_R + \bar{e}\gamma_\mu(g_{eY_V}^1 + \gamma^5 g_{eY_V}^5)eY_V^\mu$$

The interaction of mediators with dark matter is described by

$$\begin{aligned} \mathcal{L}_{XXY} \ni & g_{X_R Y_R} X_R^2 Y_R + i g_{X_C Y_V} (X_C^* (\partial_\mu X_C) - (\partial_\mu X_C^*) X_C) Y_V^\mu + \\ & \bar{X}_D (g_{X_D Y_R}^1 + v\gamma^5 g_{X_D Y_R}^5) X_D Y_R + \bar{X}_D \gamma_\mu (g_{X_D Y_V}^1 + \gamma^5 g_{X_D Y_V}^5) X_D Y_V^\mu \\ & \bar{X}_M (g_{X_M Y_R}^1 + v\gamma^5 g_{X_M Y_R}^5) X_M Y_R + g_{X_M Y_V}^5 \bar{\psi}_M \gamma_\mu \gamma^5 \psi_M Y_V^\mu \end{aligned}$$

## Detector simulation for ILC running at 500 GeV

ILCgen model for Delphes includes proper modelling of forward detectors

BeamCal Reconstruction efficiency for  $e^+e^- \rightarrow e^+e^-$

Included in the official Delphes repository as [delphes\\_card\\_ILCgen.tcl](#)

## Detector simulation

for CLIC running at 3 TeV

CLICdet model for Delphes also modified to include forward calorimeters

LumiCal + BeamCal

Reconstruction efficiency for  $e^+e^- \rightarrow e^+e^-$

Included in the repository as [delphes\\_card\\_CLICdet\\_Stage3\\_fcal.tcl](#)

## ILC vs CLIC comparison of simulation and analysis setup

	ILCgen @ 500 GeV	CLICdet @ 3 TeV
<b>Generator level cuts</b>		
$p_T^\gamma$ min.	2 GeV	5 GeV
$\Theta^\gamma$ min.	$5^\circ$	$7^\circ$
<b>Detector acceptance (Delphes model)</b>		
tracking	$ \eta  < 3$	$ \eta  < 2.54$
ECAL	$ \eta  < 3$	$ \eta  < 3$
LumiCal	$3 <  \eta  < 4$	$3 <  \eta  < 4$
BeamCal	$4 <  \eta  < 5.8$	$4 <  \eta  < 5.3$
<b>Detector level cuts</b>		
$p_T^\gamma$ min.	3 GeV	10 GeV
$ \eta^\gamma $ max.	2.8 ( $7^\circ$ )	2.6 ( $8.5^\circ$ )

## Background distributions

For considered SM backgrounds before and after detector level selection  
 (radiative) Bhabha scattering and (radiative) neutrino pair production

ILC 500 GeV  
 (-80%/+30%)  $1600 \text{ fb}^{-1}$

CLIC 3 TeV  
 (+80%)  $1000 \text{ fb}^{-1}$

## ISR rejection efficiency

Fraction of events generated by WHIZARD removed by ISR rejection procedure (ISR photons emitted in the phase-space region covered by ME)

ILC @ 500 GeV

CLIC @ 3 TeV

## Tagging efficiency

Detectable hard photon emitted only in a fraction of signal event

$$\sigma(e^+e^- \rightarrow \chi\chi\gamma_{\text{tag}}) = f_{\text{mono-photon}} \cdot \sigma(e^+e^- \rightarrow \chi\chi(\gamma))$$

ILC @ 500 GeV

CLIC @ 3 TeV

Emission strongly suppressed for narrow mediator with  $M_Y \sim \sqrt{s}$

## Systematic uncertainties

following ILD study: Phys. Rev. D 101, 075053 (2020), [arXiv:2001.03011](https://arxiv.org/abs/2001.03011)

Considered sources of uncertainties:

- Integrated luminosity uncertainty of 0.26%  
uncorrelated between polarisations
- Luminosity spectra shape uncertainty  
correlated between polarisations
- Uncertainty in neutrino background normalisation of 0.2% (th+exp)  
correlated between polarisations
- Uncertainty in Bhabha background normalisation of 1% (th+exp)  
correlated between polarisations

⇒ nuisance parameters in the model fit (7 for ILC, 5 for CLIC)

## Effective mass scale limits

$$\Lambda^2 = \frac{M_Y^2}{|g_{eeY}g_{\chi\chi Y}|}$$

For  $M_Y \gg \sqrt{s}$ , limits on the effective mass scale of new interactions no longer depend on the assumed mediator mass or width

⇒ EFT approximation can be used

ILC @ 500 GeV  $\Lambda^{\text{lim}} \sim 3 \text{ TeV}$

CLIC @ 3 TeV  $\Lambda^{\text{lim}} \sim 7 \text{ TeV}$

## Effective mass scale limits

$$\Lambda^2 = \frac{M_Y^2}{|g_{ee\gamma}g_{\chi\chi\gamma}|}$$

For  $M_Y \gg \sqrt{s}$ , limits on the effective mass scale of new interactions no longer depend on the assumed mediator mass or width

⇒ EFT approximation can be used

ILC @ 500 GeV  $\Lambda^{\text{lim}} \sim 3 \text{ TeV}$

CLIC @ 3 TeV  $\Lambda^{\text{lim}} \sim 7 \text{ TeV}$
